Hi all,

Please consider the below insights for the future of health care. We need digital records for patients to allow on-going patient data inputs, remote testing for updated records and plot the medical path of the user cohort based on all the inputs. Medical care with no to poor medical records is causing a lot of problems.

For example your parents, DNA, saliva, bloods and poo testing can plot your medical care needs for a lifetime and predict the time of care needed based on the user cohort.

We can have preventive care remotely with diet, exercise, tests and with primary care for second line support and specialist centres for third line support.

Nurses and Teachers which number 250,000 should be made redundant and paid lower tax free incomes as an emergency intervention and future proof the future of work where automation will allow lower working hours for all and free movement into lots of careers as we have the extra time for learning and community services such as child care-only the old and sick will be on social benefits.
